

Wheel rotation and distance

One complete wheel rotation moves the robot one circumference.

**circumference
= 17.5 cm**

Distance calculation

$$360^\circ \div 17.5 \text{ cm}$$

= degrees per centimeter

$$\text{degrees} = (360 / 17.5) \times \text{distance_cm}$$

Round the result to a whole number for the move command.

```
move(port, degrees, steering, speed)
```
